14-3-3γ (human), (recombinant) (His-tag)

14-3-3 proteins are dimeric phosphoserine/phosphothreonine binding proteins, which have been shown to be involved in the regulation of many crucial processes such as signal transduction, cell-cycle control, apoptosis, protein localization, phosphorylation state and stability, transcription, metabolism, and malignant transformation. Potential 14-3-3 protein–protein interactions are also differentially regulated by cytokine stimulation. One report showed that 14-3-3 expression is induced in arterial trauma by cytokines, which suggests that this protein may play an important role in progression of vascular proliferative diseases.

Handling & Storage

Long Term Storage	-80°C
Shipping	Dry Ice

Regulatory Status

RUO - Research Use Only

Product Details

Application Notes	Can be used for protein-protein interaction studies and gel overlays.
Formulation	Liquid. In 50mM NaH_2PO_4, pH 8.0, 300mM NaCl.
MW	~30 kDa
Purity	≥85% (SDS-PAGE)
Purity Detail	Purified by multi-step chromatography.
Source	Produced in *E. coli*. Human 14-3-3γ is fused at the C-terminus to a His-tag.
UniProt ID	P61981
